Sign up for Databricks Free Edition

If you're interested in Databricks for your personal use, sign up for Databricks Free Edition by going to the Databricks Free Edition signup page. Choose your preferred signup method, and then Databricks will create a new workspace for you to use.

> **NOTE**
>
> Free Edition replaced the legacy Databricks Community Edition, which was retired in 2025. If you previously used Community Edition, sign up for Free Edition to continue your work.

What is Databricks Free Edition?

Databricks Free Edition is a no-cost version of Databricks designed for students, educators, hobbyists, and anyone interested in learning or experimenting with data and AI.

Free Edition gives you an easy-to-use Databricks workspace where you can explore datasets, build and share projects, and work with AI and machine learning tools. It's ideal for learning, prototyping, and collaborative exploration.

What can you do with a Free Edition account?

Databricks Free Edition is available in a serverless-only, quota-limited environment that contains many of the same features included with the full Databricks platform, with some limitations (see Databricks Free Edition limitations). With a Free Edition account, you can do the following:

- **Build AI applications and agents**: Prepare data, experiment with foundation models, and deploy, evaluate, and govern AI systems.

Ask Genie

- **Collaborate on data science and ML projects**: Use shared notebooks to work with others in real time and publish results for others to review. Ideal for group projects, tutorials, and collaborative experimentation.
- **Explore and analyze real datasets**: Use the SQL editor or notebooks to build hands-on experience with querying and visualizing real data.
- **Create interactive dashboards**: Use Genie to interact with and visualize your data using natural-language prompts.
- **Design and test data pipelines**: Ingest, transform, and orchestrate data across different sources using Lakeflow.
- **Access Genie Code**: Use Genie Code to get in-product coding help. Genie Code can suggest, explain, and fix code directly within notebooks, queries, and files.
- **Build a database application**: Use Lakebase Postgres to build real-time transactional applications alongside your lakehouse data.

Limitations

For a list of Free Edition limitations, see Databricks Free Edition limitations.

Additional resources

Your new workspace includes serverless compute and default storage, so you can immediately start exploring and building on Databricks. Use the following tutorials to help get you started:

- Query and visualize data from a notebook
- Create your first table and grant privileges
- Use Genie Code to create visualizations
- Query LLMs and prototype agents with no code
